# DEVELOPMENT OF A RAPID HONEY SCREENING ASSAY FOR RESIDUES OF METRONIDAZOLE & DIMETRIDAZOLE

Kane N., Fergie N., Afrasiabi, Morteza.

Biorex Food Diagnostics, Unit 2C Antrim Technology Park, BT41 1QS, Antrim, Northern Ireland, United Kingdom

## BACKROUND

Nitroimidazoles, such as Metronidazole and Dimetridazole, are a family of antimicrobial agents used in the honeybee industry to prevent and control Nosemosis / Nosema. Although their use in the European Union (EU) is prohibited in all food-producing species (Group A6 of Annex I of Directive 96/23), Nitroimidazole - particularly Metronidazole - contamination of honey imported into the EU has become a significant issue.

#### RESULTS

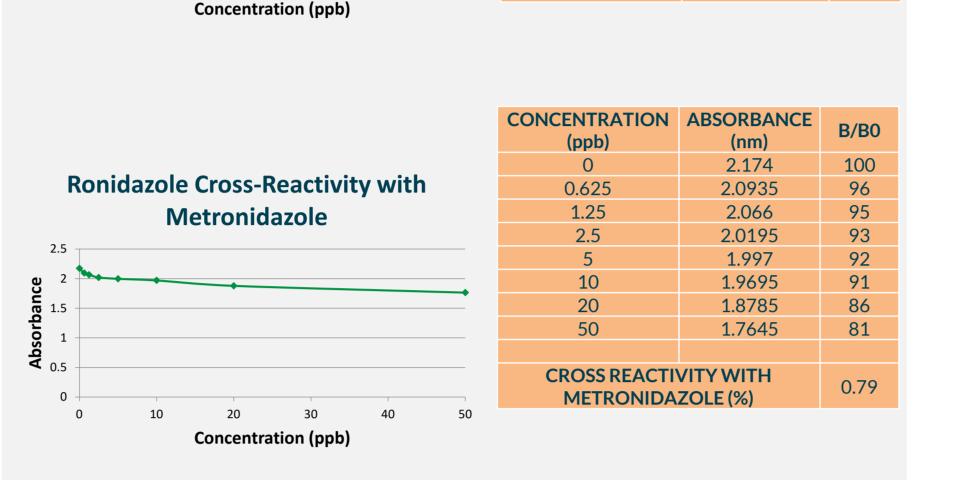

#### Calibration Range: 0.625 – 20.0 ppb

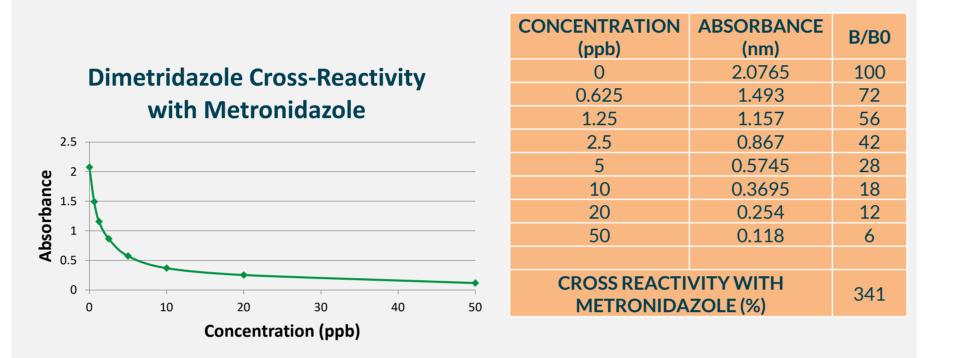

| Metronidazole Typical Standard<br>Curve  | CONCENTRATION<br>(ppb) | ABSORBANCE<br>(nm) | B/B |
|--|------------------------|--------------------|-----|

To control the integrity of honey in the EU, reliable detection methods capable of detecting a minimum concentration of  $3\mu g/kg$  (3ppb) – as set out in the Guidance Paper released by the Community Reference Laboratory (CRL) – are required. This study reports the use of one such method which can be used for the detection and quantification of Nitroimidazoles in honey.

**Figure 1:** Typical curves obtained with Metronidazole and its cross-reactants Dimetridazole and Ronidazole

The results demonstrate high cross-reactivity of Metronidazole and Dimetridazole, facilitating quantification of both Nitroimidazoles using the same Nitroimidazole kit. Cross reactivity with Ronidazole is low at only 0.79%.

**Figure 3:** Inter-assay precision for Metronidazole at 5.0ppb Inter-assay precision was examined by running one control level across twenty independent test runs. Inter-assay precision is good, with %CV  $\leq$  10%.

#### METHODS

Specific Metronidazole immunogen and antigen was prepared by using a cross linker disuccinimidyl carbonate with Jeffamine spacer between the drug and the protein molecule.

These immunogens were then injected into mice using different immunisation schemes. The best matched pair giving the best sensitivity were then chosen to be carried through into the development of this kit.

Honey samples were prepared for use on the Nitroimidazole microtitre plate (MTP) by following a simple solvent extraction protocol.

Simple Solvent Extraction Protocol

#### Intra-Assay Precision at Expected Concentration of 1.25ppb

| REPLICATE | ABSORBANCE (nm) | CONCENTRATION (ppb) |
|-----------|-----------------|---------------------|

#### **Figure 3:** Limit of Detection for Metronidazole Fifteen known negative samples were assayed using the Nitroimidazoles ELISA kit. The limit of detection (LOD) was determined by multiplying the standard deviation by three and adding to the mean concentration. The limit of detection for this ELISA is

2.3ppb

### CONCLUSIONS

The Nitroimidazole ELISA kit exhibits high cross-reactivity between Metronidazole and Dimetridazole, and can therefore facilitate the quantification of both Nitroimidazoles, with an assay time of only 55 minutes. Combined with a simple, short sample preparation method, this kit represents a fast, low-cost option for reliable detection of Nitroimidazole contamination in honey which has been both produced in, and imported to, the EU and other countries.

Solvent-based extraction using sodium chloride and ethyl acetate which is evaporated at 50°C

Reconsitution of sample in buffer supplied in the assay kit

Application of samples to ELISA test kit

Samples were run on the MTP supplied in the kit using standards and antibodies also supplied in ready-to-use form.

Figure 2: Intra-assay precision for Metronidazole at expected concentrations of 1.25ppb and 5ppb The results demonstrate good intra-assay precision with CV for absorbance much less than 10%
